## Disclaimer

---

The New Mexico Produced Water Research Consortium at New Mexico State University is conducting independent, science-based research to evaluate potential environmental and health effects related to the reuse of treated produced water for fit-for-purpose applications. This work is designed to generate objective data under controlled conditions, without promoting or opposing any specific reuse practices. Our goal is to provide clear, reliable information that supports informed decision-making around the safe and responsible use of produced water in New Mexico and beyond.

This presentation includes preliminary research data from the New Mexico Produced Water Research Consortium at New Mexico State University. The information presented is subject to change and has not yet undergone formal quality assurance or quality control (QA/QC) review. Distribution or sharing of this material without prior authorization from New Mexico State University is not permitted.

- Evaluated toxicity of model organisms across 4 trophic levels (algae, bacteria, invertebrates, fish embryos).
- System removed >99% salts, 60–100% metals, ~93% ammonia and, 43–60% organics.
- Distillate still toxic and led to failed WET tests.

- Same experimental set up but added post-treatment as GAC + zeolite.
- Re-evaluated toxicity of the same model organisms across 4 trophic levels (algae, bacteria, invertebrates, fish embryos).
- Polished distillate was toxic across the board and led to passing WET tests.

- Does polished PW have an impact on the genetic level?
- Evaluated same LTD water + MVR
  - clean brine,
  - distillate, and
  - polished PW
- 3 human cell lines
- Looked at 6 biomarkers/genes
- Results showed...

# Nitrite Assay (Oxidative Stress)

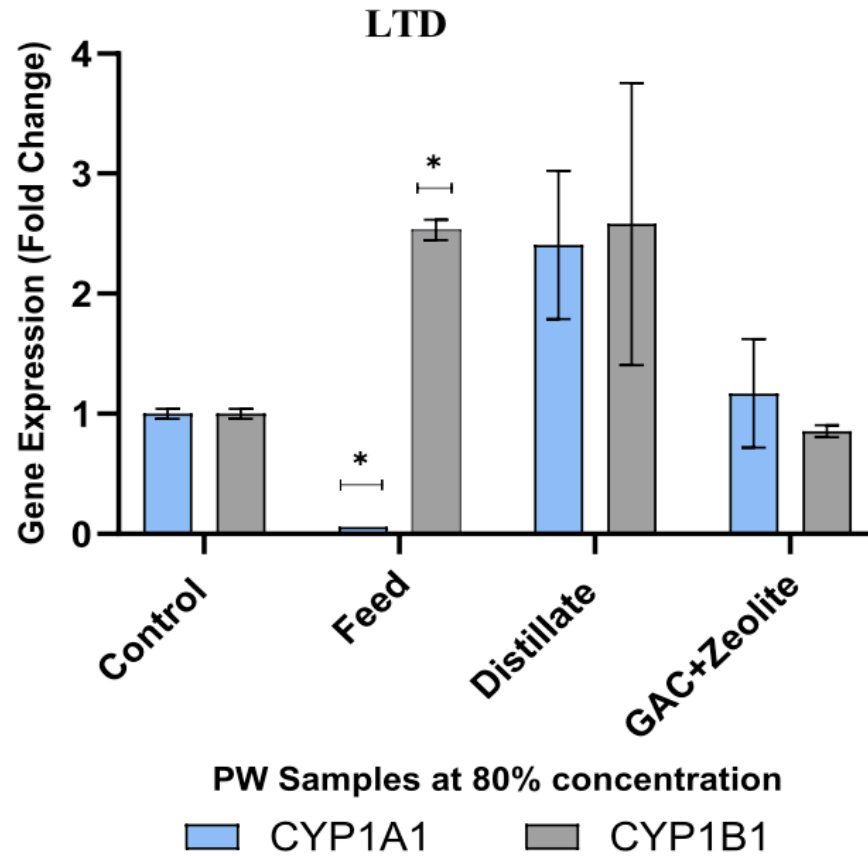

**Fig. 4.** Nitrite concentration was evaluated after exposure to 50 % feed, distillate, and distillate with GAC, followed by zeolite post-treatment PW. The \* represents the statistical difference (P-value < 0.05) in contrast to the control.

Higher nitrite concentration = higher stress

# AhR Gene Expression (Impact of PAH)

**Fig. 5.** Gene Expression of CYP1A1 and CYP1B1 using MCF-7 cell line after 24 h exposure to 80 % PW. The \* represents the statistical difference ( $P_{\text{value}} < 0.05$ ) in contrast to the control.

### 17β-estradiol concentrations (E2) and 80% PW samples

**Fig. 6.** The proliferative effect induced in MCF-7 cell lines by 17β-estradiol (E2), 50 % and 80 % feed, distillate, and GAC+zeolite treated PW. The \* represents the statistical difference ( $P_{\text{value}} < 0.05$ ) compared with the negative control.

# Summary

<div>Test \ PW</div>	Feed LTD	LTD Distillate	LTD GAC + Zeolite	Feed MVR	MVR Distillate	MVR GAC + Zeolite
<b>WET Test</b>	Fail	Fail but not as bad	Pass	<i>Fail*</i>	<i>Fail but not as bad*</i>	<i>Pass*</i>
<b>MCF-7, HEK93, Caco-2 (% Cell Viability, MTT)</b>	Low viability above 6.25% PW	High viability at or near control levels. MCF-7 some variation	Did not test	Low viability above 6.25% PW	High viability at or near control levels for all	Did not test
<b>MCF-7, HEK93, Caco-2 (% Cell Viability, Luciferase)</b>	Low viability above 6.25% PW	High viability at or near control levels. MCF-7 and HEK293 some variation	Did not test	Low viability above 6.25% PW	High viability at or near control levels	Did not test
<b>MCF-7, HEK93, Caco-2 (LDH)</b>	Increasing/dose-dependent cytotoxicity for all	No difference vs control	Did not test	Elevated cytotoxicity for all, relationship not as clear	No difference vs control	Did not test
<b>MCF-7, HEK93, Caco-2 (Nitrite)</b>	Elevated nitrite and increased oxidative stress except Caco-2	No difference vs control	No difference vs control	Elevated nitrite and increased oxidative stress	No difference vs control	No difference vs control
<b>MCF-7 (AhR)</b>	Suppressed 1A, highly upregulated 1B	Highly upregulated 1A and 1B	No difference vs control	Suppressed 1A, moderately upregulated 1B	Highly upregulated 1A, no difference vs control for 1B	No difference vs control
<b>MCF-7 (17B-estradiol)</b>	~ 2x higher proliferation effect	~ 1.5x higher proliferation effect	No difference vs control	Higher proliferation effect	~ 1.5x higher proliferation effect	No difference vs control

## Next Steps for R&T Work

- Continue NTA (non-targeted analysis) because...  
most of the organics in the LTD were not identifiable.
- Longer-term testing.
- Generational studies.

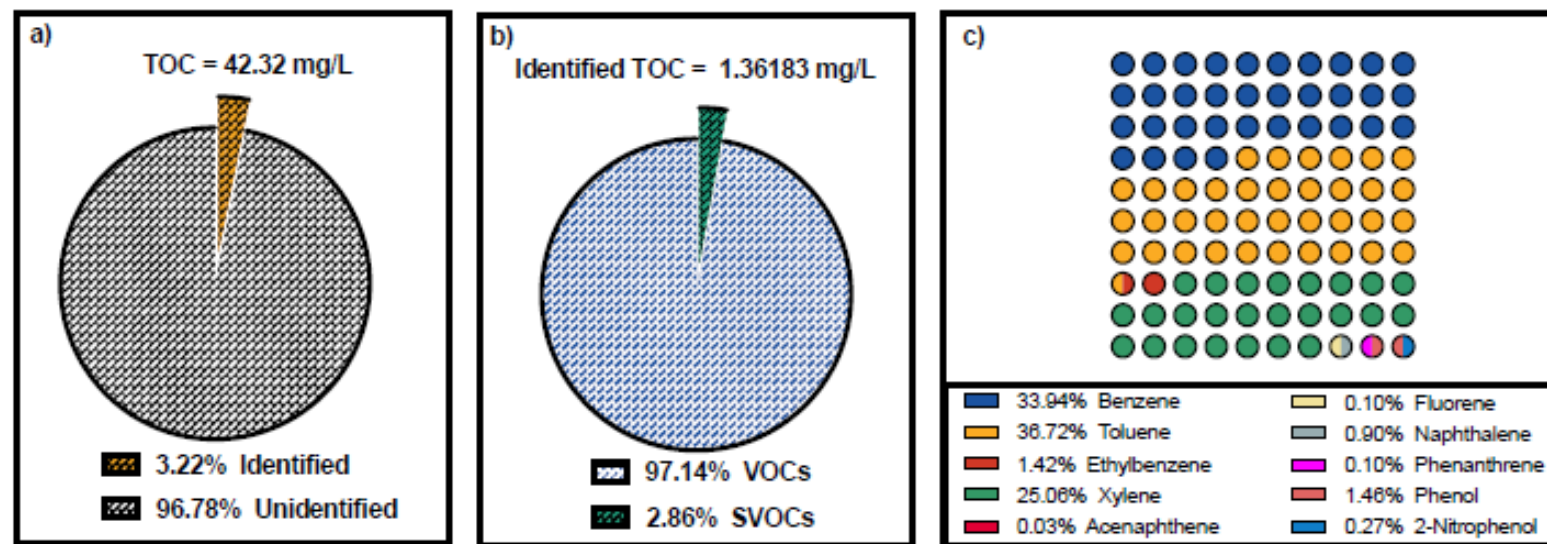

Figure 4. The composition of organics in distillate
