

# A Water Budget Perspective to Produced Water Management

Robert Sabie, Jr. Email: [rpsabie@nmsu.edu](mailto:rpsabie@nmsu.edu)

New Mexico Water Resources Research Institute | New Mexico State University

Produced Water Research Consortium - 2022 Annual Meeting

Las Cruces, New Mexico

Tuesday, December 6<sup>th</sup>, 2022

# New Mexico Water Resources Research Institute -History

## **Established in response to drought of 1950s in New Mexico**

- 1956 First annual New Mexico Water Conference

## **Long history of supporting statewide water research**

- 1963 NM WRRRI established

## **Special relationship with nationwide network of water institutes**

- 1964 Water Resources Research Act set up network of water research institutes  
(one in every state plus three territories and the District of Columbia ; PL 88-379.2 introduced by NM Senator Clinton P. Anderson modeled on NM WRRRI)

## **Statewide mandate**

- NM WRRRI statewide cooperation with New Mexico State University, the University of New Mexico, New Mexico Institute of Mining and Technology, New Mexico Highlands University, Eastern New Mexico University and Western New Mexico University

# NM WRRI Overview

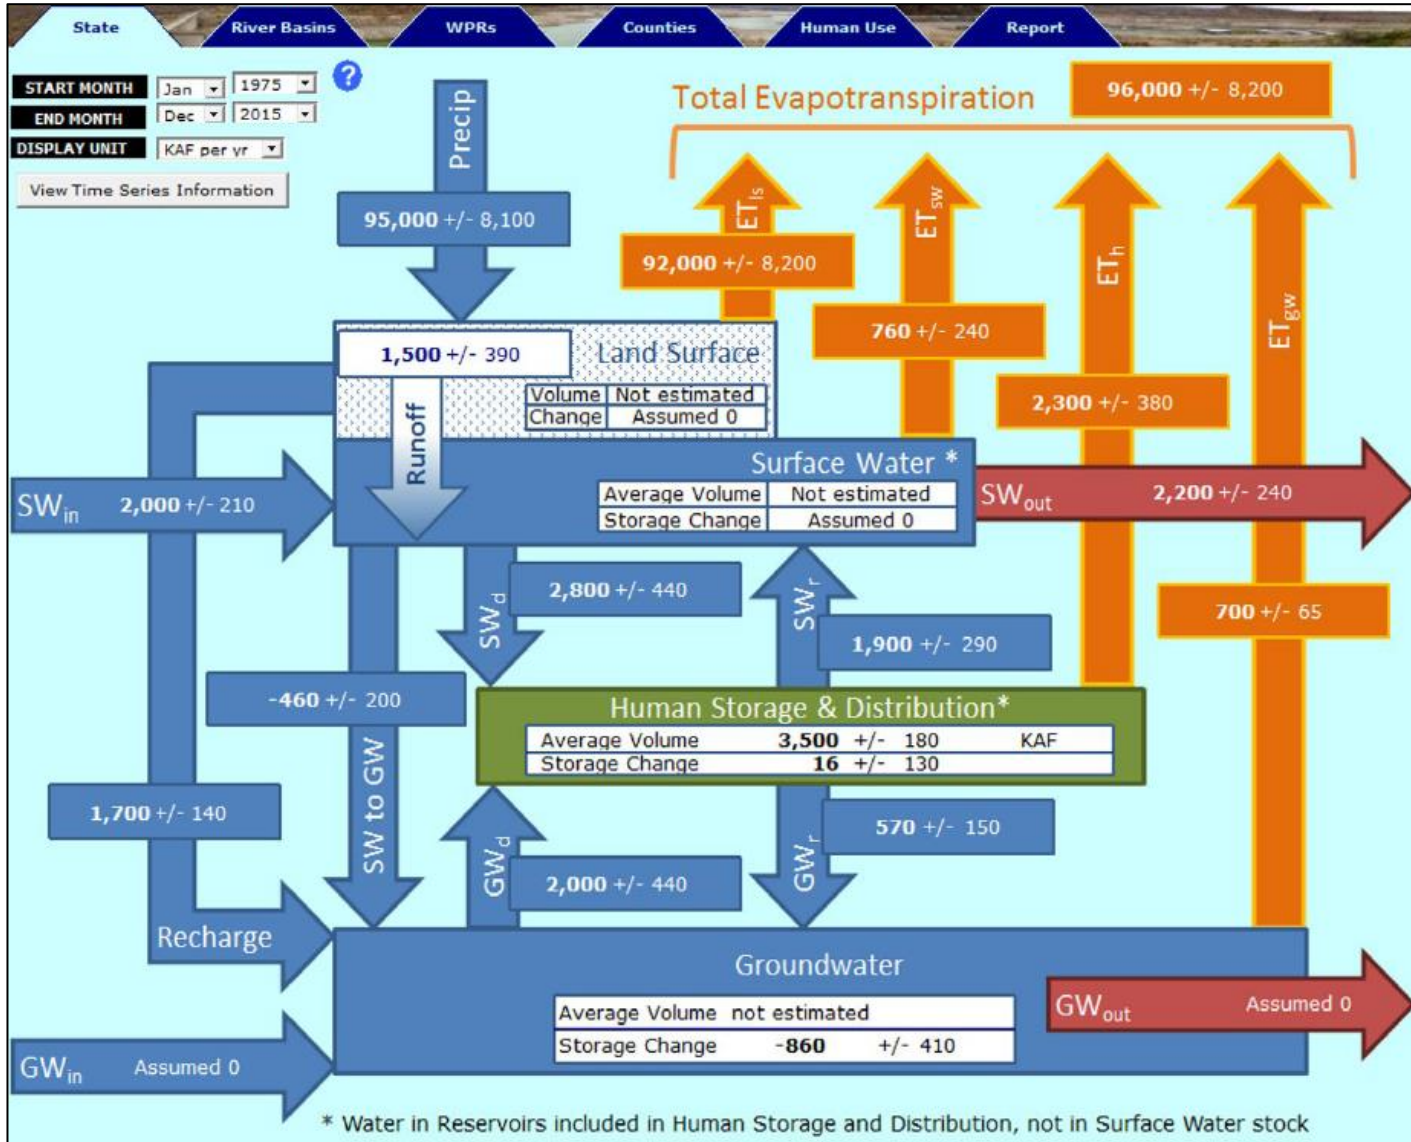

Mission: to develop and disseminate knowledge that will assist the state and nation in solving water problems.

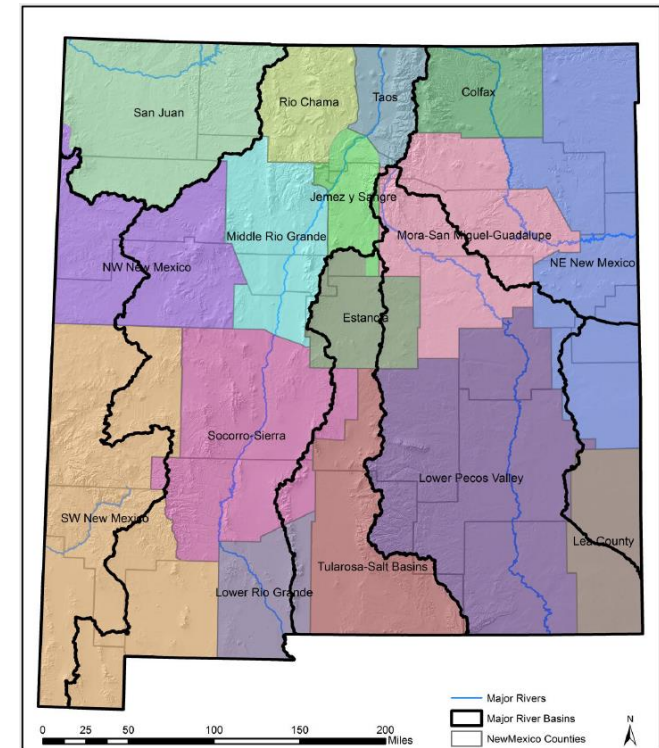

## New Mexico Statute 21-8-40 of 2005:

- **Provide research and training** in water conservation, planning, and management; atmospheric-surface-groundwater relations; and water quality;
- **Transfer water information** through the use of technical and miscellaneous publications, newsletters, conferences, and presentations;
- **Provide expertise, specialized assistance, and information** to address water problems; and
- **Cooperate** with local, state, and federal water agencies.

# NM Dynamic Statewide Water Budget

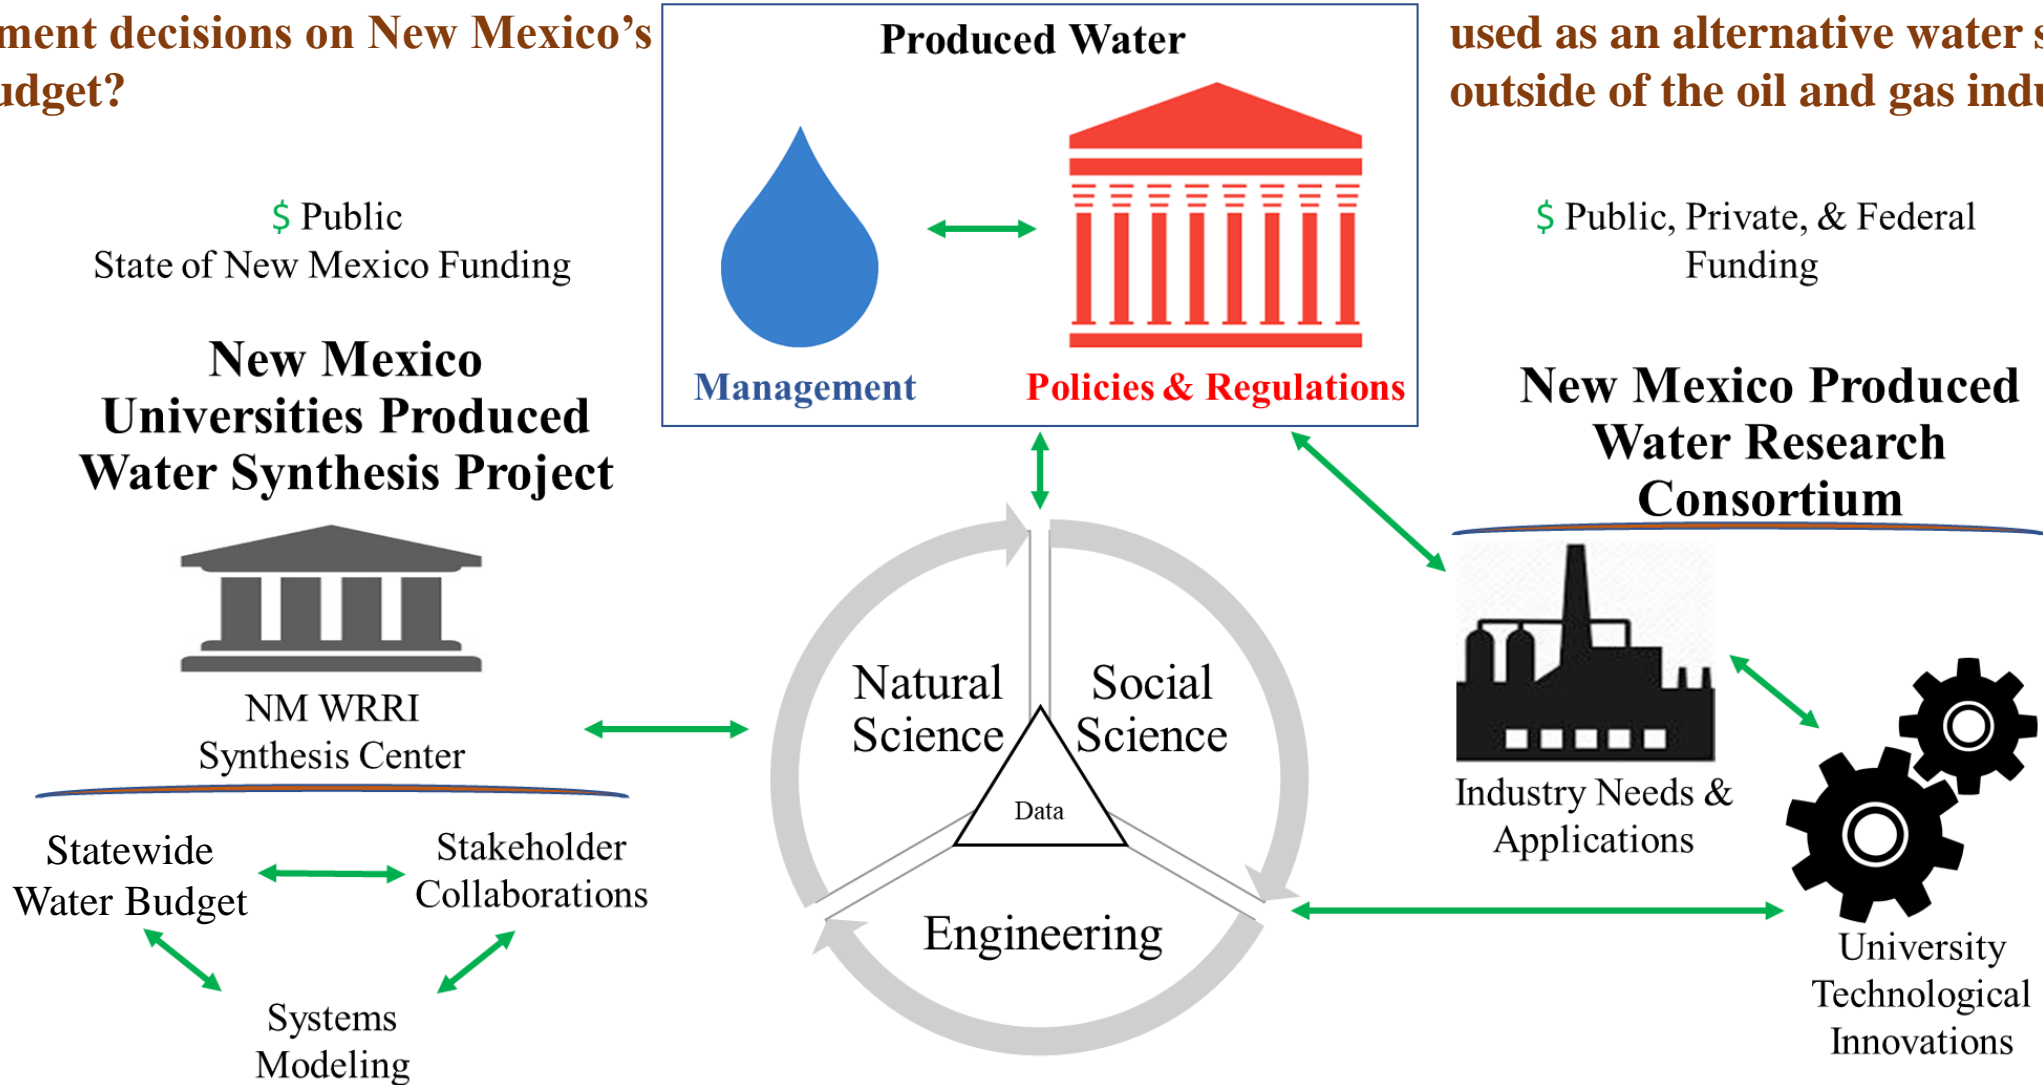

- Stocks & flows
  - Monthly timestep
  - Mass balance
- Historical (1975–2015) & future (2015–2099)
- Counties (33)
- Water Planning Regions (16)
- Major river basins (7)
- Statewide (1)

# Produced Water Research

What are the impacts of produced water management decisions on New Mexico's water budget?

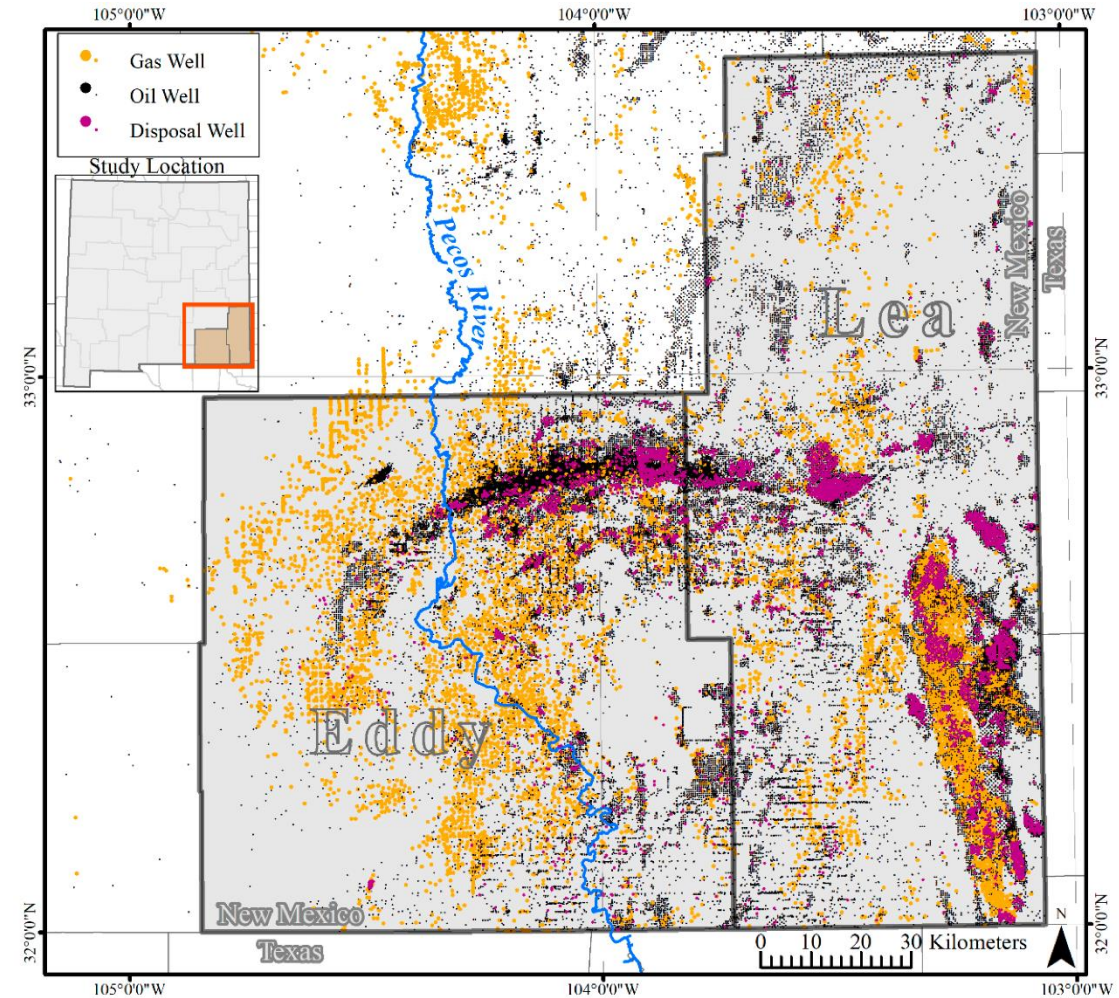

How can treated produced water be safely used as an alternative water source outside of the oil and gas industry?

# Studies Published in *Water*:

Sabie, R., Langarudi, S.P., Perez, K., Thomson, B. and Fernald, A., 2022. **Conceptual framework for modeling dynamic complexities in produced water management.** *Water*, 14(15), p.2341.

Sabie, R.P., Pillsbury, L. and Xu, P., 2022. **Spatiotemporal Analysis of Produced Water Demand for Fit-For-Purpose Reuse—A Permian Basin, New Mexico Case Study.** *Water*, 14(11), p.1735.

# Conceptual Framework for Modeling Dynamic Complexities in Produced Water Management

## Goal:

Provide a conceptual framework to describe the connections of PWM to regional water budgets.

## Driving issues:

- Looming shortfalls in water availability
- Oil and gas production generate high volumes of produced water in the region
- Modeling efforts typically do not connect to the regional water budget

## Methods:

Expert interviews, analysis of industry data, and information gained at industry meetings.

Change in storage = inflows – outflows + source – sinks

$$\Delta S = Q_{in} - Q_{out} + P - ET$$

P = precipitation

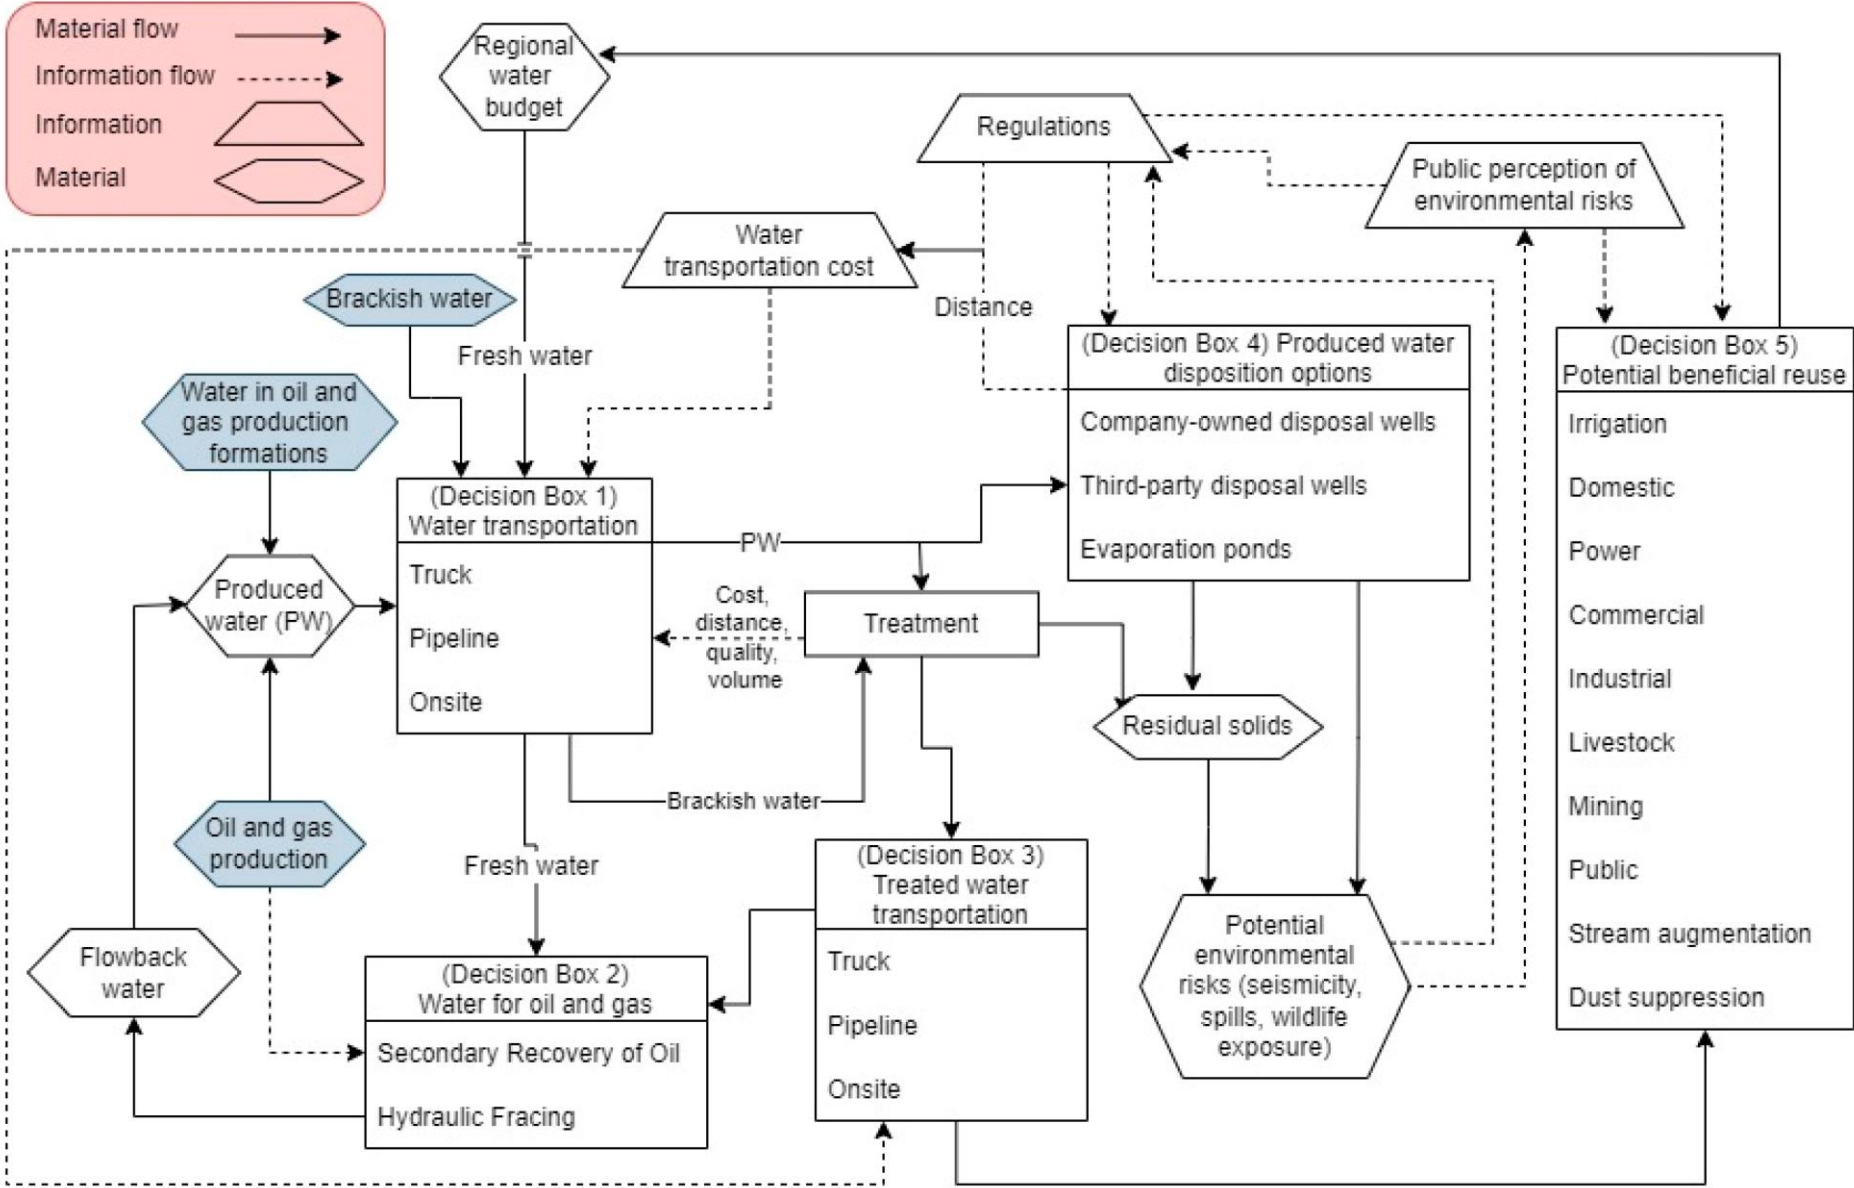

$Q_{in}$  = water flow into the watershed

ET = evapotranspiration

$\Delta S$  = change in water storage

$Q_{out}$  = water flow out of the watershed

# Conceptual Framework

# Spatiotemporal Analysis of Produced Water Demand for Fit-For-Purpose Reuse—A Permian Basin, New Mexico Case Study.

Goal: Provide a framework for assessing the spatial and temporal distribution of potential fit-for-purpose demand

Driving issues:

- Looming shortfalls in water availability
- Increase demand for disposal of large volumes of produced water

Assumptions:

- Regulations allow for reuse outside of industry
- No cost barriers for treatment

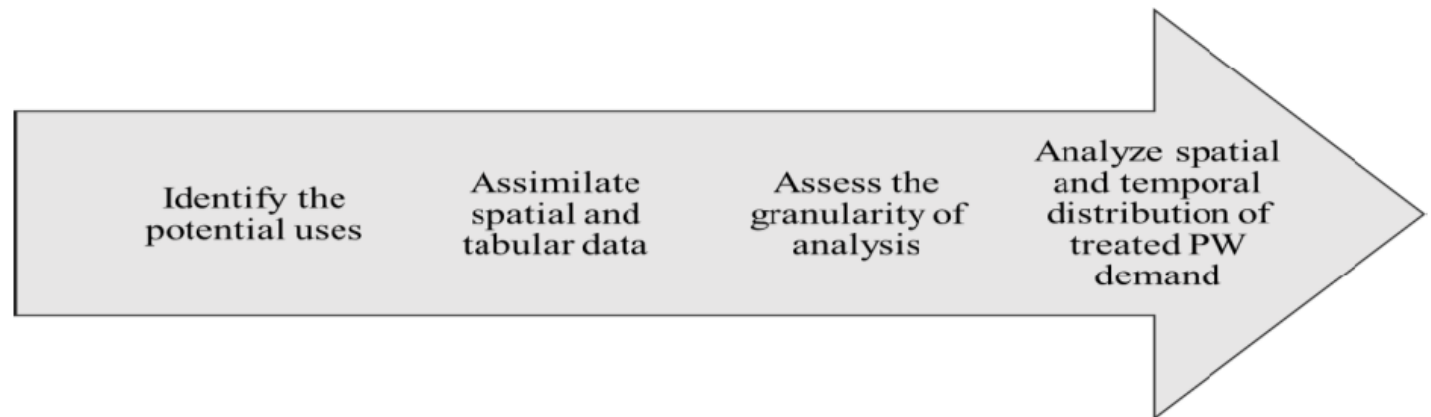

Figure 1. General framework for assessing demand of treated PW.

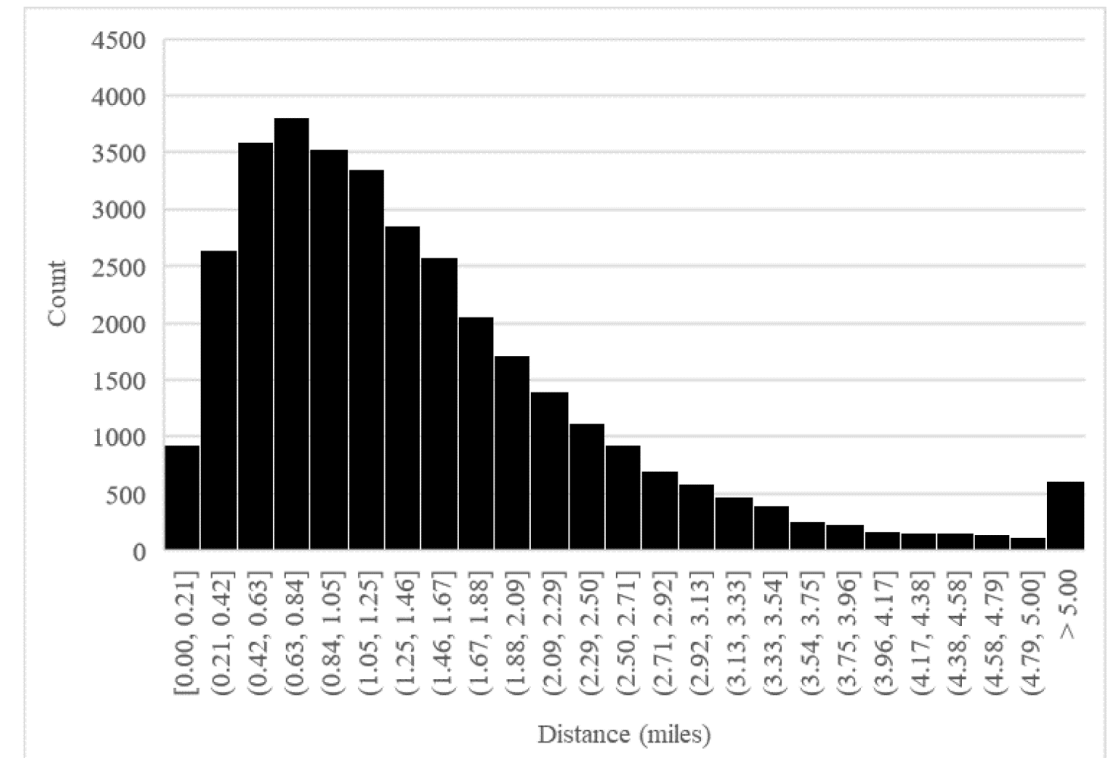

# Determining Grid-cell Size

- Provide detail at a level where any increase in granularity provides little additional unique information for the intended purpose
- Avoid over aggregation and modifiable areal unit problem
- Median distance from oil and gas production wells to SWD in Eddy County was 1.1 miles

<https://gisgeography.com/maup-modifiable-areal-unit-problem/>

	Eddy	Lea	Eddy and Lea
Mean	1.51	1.53	1.52
Median	1.10	1.34	1.21
Mode	0.51	0.83	0.51
Range	16.06	8.02	16.06
Minimum	0.00	0.01	0.00
Maximum	16.06	8.02	16.06
Count	17299	17211	34510

# Estimated Available Produced Water Volume (per grid cell)

- Count active vertical and horizontal wells in grid cell
- Multiply by average PW vol/yr
- Multiply by 0.42 to account for the estimated amount currently being reused within industry
- Multiply by 0.5 to account for a 50% recovery rate
- Eddy County: 22,855,016 m<sup>3</sup> (18,536 acre-feet)
- Lea County: 22,605,859 m<sup>3</sup> (18,334 acre-feet)

**Table 1.** Average annual PW volume per well for oil and gas wells in southeastern New Mexico in 2019.

	Wells	Horizontal Well Avg. PW/yr (m <sup>3</sup> )	Vertical Well Avg. PW/yr (m <sup>3</sup> )
Oil	21907	19560	3340
Gas	2850	48330	2540

Data from Jiang et al. [21].

0 20 40 60 Kilometers

# Agricultural Water Demand

Estimated  
 Eddy :170,944 acre-feet  
 Lea: 343,915 acre-feet

**Figure 3.** a) Cumulative growing degree days (GDD) at base 50, and b) reference evapotranspiration 294 in for the Artesia Agricultural Science Center in 2021.

# Hypothetical – Dust Suppression Use of Treated Produced Water

Estimated unpaved roads

Eddy: 9,884 miles

Lea: 8,776

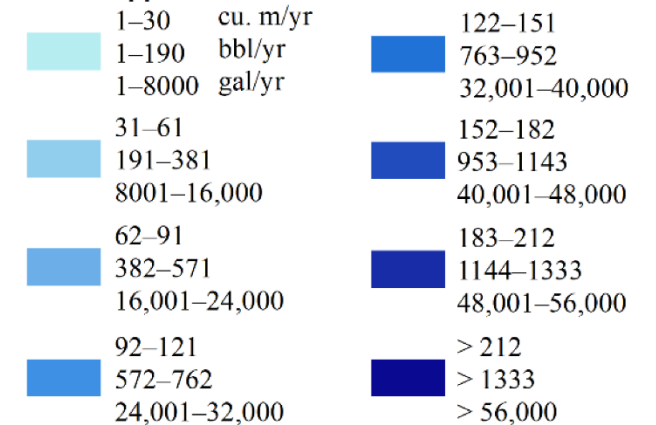

Assumed application rate of 3,388 gallons/mile

33,488,465 gallons/year or 797,344 bbls/year

1.1-mile grid

Dust Suppression Demand

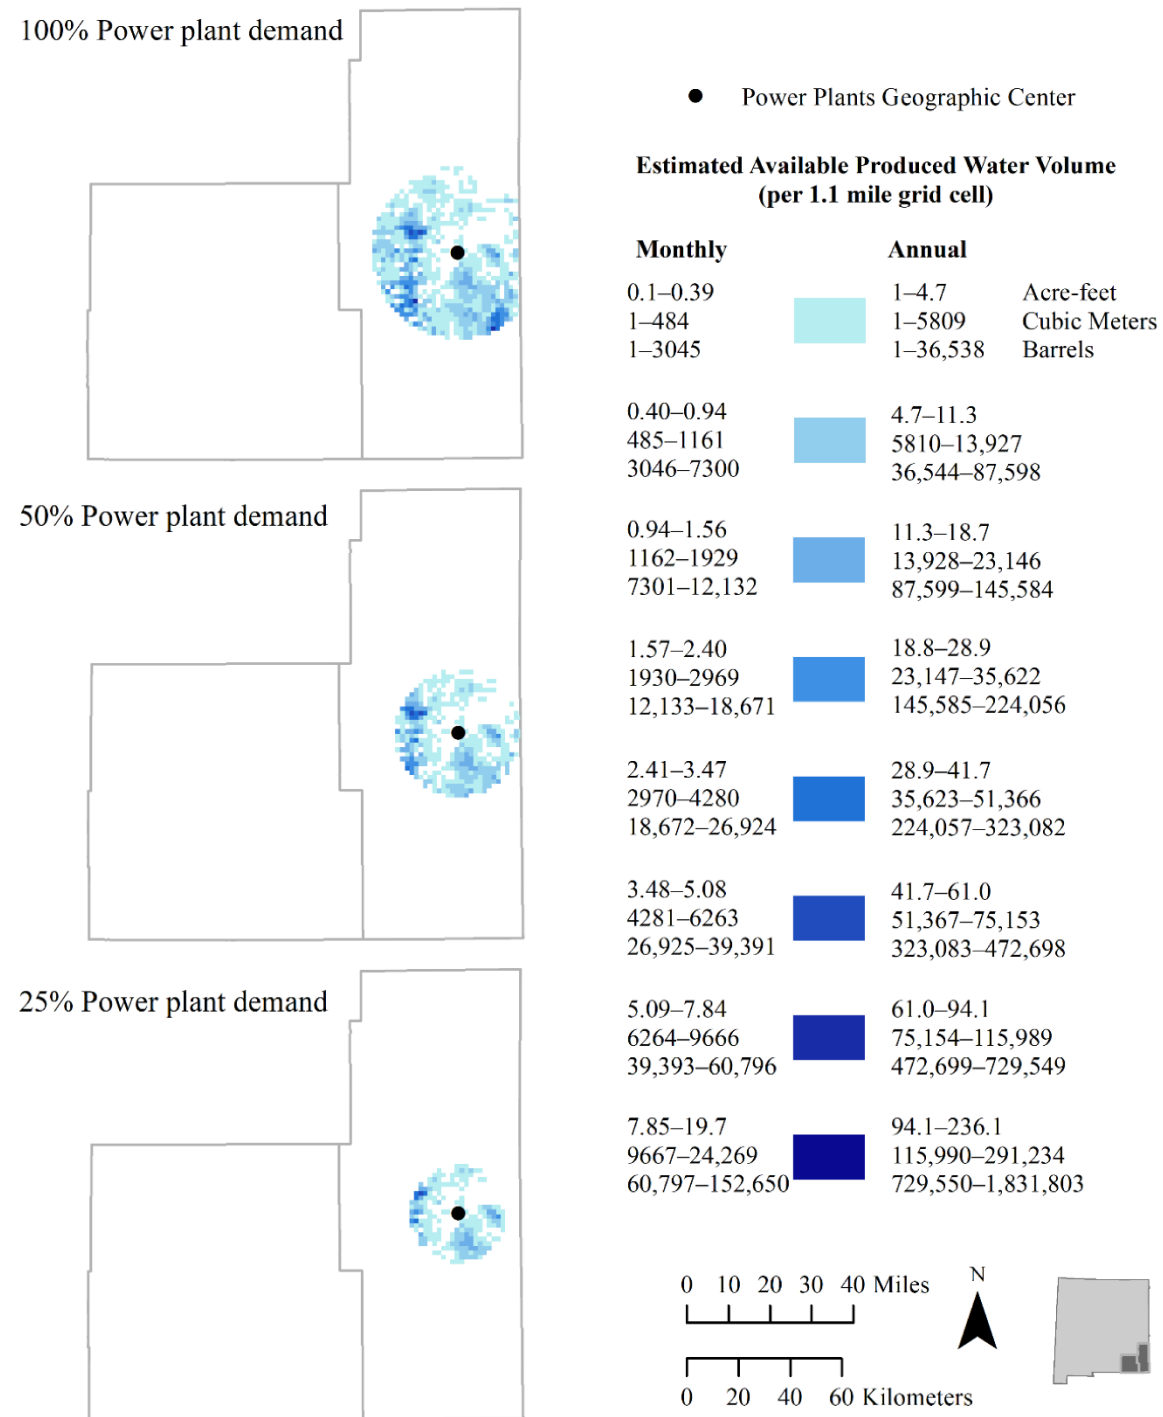

Estimated water demand for dust suppression based on the length of unpaved roads within each grid cell.

# Hypothetical – Power Plant Use of Treated Produced Water

Assumed demand: 4,472 acft

Area of collection required based on estimated supply to meet 100%, 50%, and 25% of the water demand for power plant demand in Lea County.

Collection area was 821 mi<sup>2</sup>, 455 mi<sup>2</sup>, and 252 mi<sup>2</sup>, respectively

# Hypothetical- Pecos River Augmentation with Treated Produced Water

- Assumed an augmentation demand of 10,000 acft (77.5 million bbl)
- Area of collection required based on estimated supply to meet 100%, 50%, and 25% of the water demand for Pecos River augmentation.
- Collection area was 1,488 623 mi<sup>2</sup>, 1,048 mi<sup>2</sup>, and 667 mi<sup>2</sup>, respectively
- Many of the grid cells generate less than 2 acre-feet of produced water per year

100% Pecos augmentation demand

50% Pecos augmentation demand

25% Pecos augmentation demand

| 0.1–0.39  | 1–4.7      | 1–484       | 1–3045         |         |
| 0.40–0.94 | 4.7–11.3   | 485–1161    | 3046–7300      |         |
| 0.94–1.56 | 11.3–18.7  | 1162–1929   | 7301–12,132    |         |
| 1.57–2.40 | 18.8–28.9  | 1930–2969   | 12,133–18,671  |         |
| 2.41–3.47 | 28.9–41.7  | 2970–4280   | 18,672–26,924  |         |
| 3.48–5.08 | 41.7–61.0  | 4281–6263   | 26,925–39,391  |         |
| 5.09–7.84 | 61.0–94.1  | 6264–9666   | 39,393–60,796  |         |
| 7.85–19.7 | 94.1–236.1 | 9667–24,269 | 60,797–152,650 |         |

# Next steps

1. Use conceptual modeling framework to construct a modeling component that connects produced water management decisions.
2. Incorporate pipelines/distribution network into spatial model.

Thank you!
